Dept. of Commerce, National Institute of Standards and Technology, 2004 OCLC Number: (OCoLC)123903949 Subject: Smart cards -- Standards -- United States. Excerpt: . . . During the Multi-technology Integration session, vendors mentioned printing problems associated with multi-technology cards. A lack of common standards for post-embedding printing results in issuers having to choose their own card designs and to dictate the amount of data to be printed on the card. Because the standards permit variations in the color of plastic, thickness of the card, and exact location of the contacts or antenna, considerable variation may exist in the cards manufactured by different vendors. This variation may result in problems when an agency has a pre-set process to print or embed material on certain locations on a card. 2. 2. 5 Interoperability Requirements and Issues During the Interoperability session, Federal government participants pointed out that unique requirements of individual agencies could result in multiple physical access credentials per employee. This could potentially result in unnecessary cost to the Federal government. The use of multiple credentials also creates inefficiencies resulting from an excessive number of policy and technical processes being established by different agencies. It was also noted that lack of biometrics interoperability resulted in implementations that use multiple biometrics templates from different vendors. For example, one card may potentially carry two fingerprint templates: one for airport access, and one for government physical access. A Department of State participant emphasized that no standardized tests existed for a comparison of optical effectiveness and clarity of holograms or diffraction gratings. This issue could potentially result in holograms from different vendors with varying reliability and quality levels. Panelists reported difficulty in implementing PKI in the...
