Excerpt: .if they had been run north from the next southern parallel. This point is obtained from computation, and is less than twenty-four miles from the next eastern or western meridian by the convergence of the meridians in twentyfour miles. In case guide meridians have been improperly located too far apart, auxiliary meridians may be run from standard corners, and these may be designated by a local name. The angular convergence of two meridians is given by the equation $f = m \sin L$ (1) where m is the angular difference in longitude of the meridians, and L is the mean latitude of the north and south length under consideration. The linear convergence in a given length l is $c = l \sin \$$ (2) The radius of a parallel at any latitude L is given by the equation $r = \cos L$ (3) where R is the mean radius of curvature of the earth. The distance between meridians is usually given in miles and this must be reduced to degrees. To do this it is first necessary to find the linear value of one degree of longitude at the mean latitude from the proportion. 1: 360:: x: 2-nr (4) the value of r being found from (3) Equation (4) will give results sufficiently accurate, although in strict accuracy R should be the radius of curvature at the mean latitude. For full details of public-land surveying, see Manual of Surveying Instructions for the Survey of the...
